DETAILED ACTION

Allowable Subject Matter

1. In response to Office Action of July 21, 2003, an "Amendment" was received on January 26, 2002. Claims 2-4 and 7-21 have been canceled, and claims 1, 5-6 and 22-25, 27, 28, 30; 32-35, 37-40 have been amended.

2. Claims 1, 5-6 and 22-40 are allowed.

3. The following is an examiner's statement of reasons for allowance:

With respect to independent claims 1, 22, 27, 32 and 37, prior art fails to disclose a radiographic camera, comprising: a body suitable for use in a pipeline; a jacket having front and a back ends; and a handle positioned between the front and the back ends, the handle constructed and arranged to carry the camera, wherein the jacket is adapted to be removably secured to the camera and the camera is functional with or without the jacket. The radiographic camera also houses a radioactive source in a pathway surrounded by a radiation shield with first and second end of the housing having a lock assembly, wherein the lock assembly functions independently of the radiation shield protector and guide cable fitting, a rotor rotatably attached to the interior surface in such a way that the rotor is locked in position with the radiation shield aligned properly, and is adapted to be unlockable when a fitting is engaged in a hole on the front plate.

In the prior art, in radiographic cameras used to record images of the interior structure of metals, a lock assembly is provided over an opening at the back end of the

camera and control cables are attached to the back end, which prevents the radiation source from being pushed out of the front end without first using a key to unlock the camera, and then connecting a control cable. In such a case, a plug assembly blocks the front opening when in stored position. The plug cannot be completely removed from the connector assembly until a shield is first moved to block the opening by operating a manually actuable slide. An interlock mechanism is also used between the lock assembly at the back of the camera and the connector assembly, so that the lock assembly cannot be actuated to receive the control cables until the guide is coupled to the front end. Thus, either the guide cable or plug assembly must be on the connector assembly in order for the lock assembly to be accessed.

The current invention of a radiographic camera discloses many improvements over prior art. In one illustrative embodiment of the invention, a jacket for the radiographic camera includes front and back ends and a handle positioned between the ends, where the handle includes reinforcement structure, and the jacket has an opening for receiving a radiographic camera that extends through the front end of the jacket. The jacket may be removably secured to the radiographic camera so that it may be removed from the camera, if desired. In another illustrative embodiment of the invention, a method of operating a radiation camera is provided. The method includes the step of unlocking a shield protector that blocks a radiation source opening of the camera. Further, steps include moving the shield protector to unblock the radiation source opening and moving a radiation source from within the camera through the radiation source opening. The step of unlocking the shield protector may include attaching a

guide cable fitting to the camera. The step of unlocking the shield protector may include engaging the guide cable fitting with a slider. The step of moving the shield protector may include rotating a knob attached to the shield protector to align a hole on the shield protector with the radiation source opening.

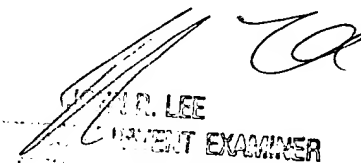

Claims 5-6, 23-26, 28-31, 33-36, and 38-40 are allowed by virtue of their dependencies on the independent claims 1, 22, 27, 32, and 37.
